Please find below and/or attached an Office communication concerning this application or proceeding.

The time period for reply, if any, is set in the attached communication.

Office Action Summary

Application No.

10/617,042

Applicant(s)

ISHIDA, YOSHIHIRO

Examiner

Kathleen S. Yuan

Art Unit

2624

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 05 April 2007.
- 2a) ☐ This action is FINAL. 2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1-11 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 1-11 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on _____ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☒ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☒ All b) ☐ Some * c) ☐ None of:
- ☐ Certified copies of the priority documents have been received.
 - ☐ Certified copies of the priority documents have been received in Application No. _____.
 - ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

Attachment(s)

- ☒ Notice of References Cited (PTO-892)

DETAILED ACTION

The response received on 4/05/2007 has been placed in the file and was considered by the examiner. An action on the merit follows.

Response to Amendment

1. The amendments filed on 5 April 2007 have been fully considered. Response to these amendments is provided below.

Summary of Arguments/Amendments and Examiner's Response:

2. Applicant's arguments with respect to the claims have been considered but are moot in view of the new ground(s) of rejection.

Claim Rejections - 35 USC § 112

3. The following is a quotation of the second paragraph of 35 U.S.C. 112:

The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.

4. Claims 3 and 7 are rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention.

5. Regarding claims 3 and 7, both claims claim, "means for rotating an image," and later claim that the means rotates the input image. It is unclear as to if the means is rotating more than just the input image since it also rotates "an image." Appropriate correction is required.

Claim Rejections - 35 USC § 103

6. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

7. Claims 1, 2, 4/1, 4/2, 5, 6, 8/5, 8/6, 9/1, 9/2, 10/1, 10/2, 11/1 and 11/2 are rejected under 35 U.S.C. 103(a) as being unpatentable over U.S. Patent No. 6597817 (Silverbrook) in view of U.S. Patent No. 7050607 (Li et al).

Regarding claim 1, Silverbrook discloses an image processing apparatus comprising (fig. 2): image input means for inputting an image: an area image sensor (col. 3, lines 33-34); image attached information input means for inputting information attached to the image input by the image input means: the attached information being the corresponding orientation angle and the means being the orientation sensor (col. 3, lines 30-32); face detection means for detecting a face from the image input by the image input means, an algorithm that detects a face (col. 3, lines 46-52). Silverbrook basically states that after experiencing an image input and sensing a basic orientation, and thus finding the right side up, face detection algorithms can be used (col. 3, lines 46-52).

Silverbrook does not disclose expressly that the algorithms include face-detection angle-range information determination means for determining an angle range used in a process of detecting a face from the input image on the basis of the image

attached information input by the image attached information input means; and process control means having a mode to control the execution of the face detecting process on the basis of information indicating the angle range determined by the face-detection angle-range information determination means.

Li et al discloses face detection angle-range information determination means, a detector pyramid (col. 6, lines 20-22) for determining an angle range used in a process of detecting a face from an input image (col. 6, lines 17-32) on the basis of the image attached information input, corresponding to Silverbrook's orientated, right-side up image, which also corresponds to Li et al using a right-side up image (fig 8), and even going to a another step of limiting the right-side up image in sub-windows (col. 6, lines 39-41). Li et al further discloses process control means (fig. 6, fig. 3), having a mode to control the execution of the face detecting process on the basis of information indicating the angle range determined by the face-detection angle-range information determination means (col. 6, lines 22-57), since the layered system has many layers or modes to control the face detection on the basis of the indicated angle range of the layer.

Silverbrook and Li et al are combinable because they are from the same field of endeavor, i.e. facial image processing.

At the time of the invention, it would have been obvious to a person of ordinary skill in the art to use an angle range to detect a face.

The suggestion/motivation for doing so would have been to provide a more thorough, more accurate recognition by considering all possible angle ranges a face could be in.

Therefore, it would have been obvious to combine the apparatus of Silverbrook with the range of angles of Li et al to obtain the invention as specified in claim 1.

8. Regarding claim 2, Li et al discloses that the process control means controls the execution of the face detecting process in predetermined angle increments, the predetermined angle increments being those of the different layers (col. 6, lines 25-32).

9. Regarding claim 4/1, Li et al discloses reference data conversion means, that which captures images for training data in fig. 3, step 302 and continues to convert training data in step 304, for converting face detection reference data by cropping and normalizing, used for face detection into reference data for a tilted face, since the data is used to train a pyramid for the classifiers which is used in the face detection (fig. 3, step 306), wherein the process control means allows the reference data conversion means to convert the face detection reference data into reference data for a tilted face in order to form tilted-face reference data in predetermined angle increments, the angle increments being the predetermined angle ranges shown in fig. 4, and the tilted-face reference data being the data that is used to train the pyramid in fig. 3 step 306, and executes the face detecting process to the input image using the formed tilted-face reference data, since the reference data is used to train the pyramid (fig. 4).

10. Claim 5 is rejected for the same reasons as claim 1. Thus, the arguments analogous to that presented above for claim 1 are equally applicable to claim 5. Claim 5 distinguishes from claim 1 only in that claim 5 is an image processing method, and claim 1 is an apparatus. Since an apparatus carries out a method, prior art applies.

11. Claim 6 is rejected for the same reasons as claim 2. Thus, the arguments analogous to that presented above for claim 2 are equally applicable to claim 6. Claim 6 distinguishes from claim 2 only in that they have different dependencies, both of which have been previously rejected. Therefore, prior art applies.

12. Claims 4/2, 8/5 and 8/6 are rejected for the same reasons as claim 4/1. Thus, the arguments analogous to that presented above for claim 4/1 are equally applicable to claims 4/2, 8/5 and 8/6. Claims 4/2, 8/5 and 8/6 distinguish from claim 4/1 only in that they have different dependencies, both of which have been previously rejected. Therefore, prior art applies.

13. Claims 9/1, 9/2 10/5, 10/6, 11/5 and 11/6 are rejected for the same reasons as claim 1. Thus, the arguments analogous to that presented above for claim 1 are equally applicable to claims 9/1, 9/2 10/5, 10/6, 11/6 and 11/5. Claims 9/1, 9/2 10/5, 10/6, 11/6 and 11/5 distinguish from claim 1 only in that claims 9/1, 9/2 10/5, 10/6, 11/6 and 11/5 are program and storage medium claims and claim 1 is an apparatus claim and they have different dependencies. Since all the dependencies have been previously rejected, and since the preamble to the claim is not given any patentable weight because it doesn't breath life or vitality into the claim, and since all other limitations are addressed in claim 1, prior art applies.

14. Claims 3/1, 3/2, 7/5 and 7/6 are rejected under 35 U.S.C. 103(a) as being unpatentable over Silverbrook in view of Li et al, as applied to claims 1, 2, 5 and 6

Art Unit: 2624

above, and further in view of U.S. Patent Application Publication No 20010019620 (Nagai et al).

Regarding claim 3/1, Silverbrook (as modified by Li et al) discloses all of the claimed elements as set forth above and incorporated herein by reference.

Silverbrook (as modified by Li et al) does not disclose expressly image rotation means for rotating an image, wherein the process control means allows the image rotation means to rotate the input image in order to form images in predetermined angle increments, and performs the face detecting process to the respective images.

Nagai et al discloses image rotation means (fig. 4) for rotating an image, since an image is rotated around an axis by taking more images at a different rotation angle (fig. 4, item 108 and 109), wherein the process control means allows the image rotation means to rotate the input image in order to form images in predetermined angle increments, the angle increments being the predetermined distance (page 4, paragraph 0059) around the subject and thus a predetermined angle (fig. 2), and performs a face detecting process to the respective images by detecting skin color ratio and thus the face detecting (fig. 4, step 104). It is noted Nagai has a different way of detecting the face as Li et al does, but they are both face detection processes and thus both applicable to each other.

Silverbrook (as modified by Li et al) and Nagai et al are combinable because they are from the same field of endeavor, i.e. face detection.

At the time of the invention, it would have been obvious to a person of ordinary skill in the art to form images around the input image.

Art Unit: 2624

The suggestion/motivation for doing so would have been to provide a more robust system, and a more widely applicable system by allowing the system to obtain an optimal image.

Therefore, it would have been obvious to combine the apparatus of Silverbrook (as modified by Li et al) with the multiple images of Nagai et al to obtain the invention as specified in claim 3/1.

15. Claims 3/2, 7/5 and 7/6 are rejected for the same reasons as claim 3/1. Thus, the arguments analogous to that presented above for claim 3/1 are equally applicable to claims 3/2, 7/5 and 7/6. Claims 3/2, 7/5 and 7/6 distinguish from claim 3/1 only in that they have different dependencies, both of which have been previously rejected.

Therefore, prior art applies.

Conclusion

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Kathleen S. Yuan whose telephone number is (571)272-2902. The examiner can normally be reached on Monday to Thursdays, 9 AM to 5 PM.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Joseph Mancuso can be reached on (571)272-7695. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Art Unit: 2624

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see <http://pair-direct.uspto.gov>. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free). If you would like assistance from a USPTO Customer Service Representative or access to the automated information system, call 800-786-9199 (IN USA OR CANADA) or 571-272-1000.
